

HOW TO USE Booster Beads - Grill top Cleaner

Booster Beads are a granular solid bead that when diluted into water become a powerful carbon and grease cleaner. To use Booster Beads effectively, a large steel soak tank must be manufactured ([HOW TO Build a Soak Tank](#)) to submerge the dirty grill tops for 12 to 24 hours. Once your dirty grill tops have been soaked, a pressure washer may be used to quickly and easily strip away even the toughest carbon stains and baked on grease. By utilizing this system, even your oldest, dirtiest grill tops can be

quickly cleaned to an almost brand new appearance.

- Ideal for cleaning carbon & grease stains from cast iron, stainless steel, and nickel plated grill tops
- Significantly reduce the time (and expense) required to clean a BBQ grill after each rental.
- If extra grill tops (clean) are included in your inventory and you line your charcoal fireboxes with aluminum foil, additional rentals can be booked by allowing immediate turn around of your existing grills. This will create additional rental income with very little additional expense (an extra grill top).
- Each 10 lb. bucket of Booster Beads cost \$48.75 and yields 50 gallons of reusable cleaning solution at only 98 cents per gallon. This is the most cost effective cleaning solution available.
- When used in a soak tank, Booster Beads can be used for approximately 6 months with limited evaporation.

Booster Beads are a caustic solution. Therefore, prior to using Booster Beads as part of a daily cleaning procedure, users must be thoroughly familiar with the product's characteristics and handling requirements. Please contact a Big John sales representative for further information or suggestions.
